Surprisingly, I didn't notice many differences when testing my site on Chrome, Firefox, and Safari. However, some minor inconsistencies included the variation in the form styling and icon sizes. For example, Chrome had a thicker border around the radio buttons than Firefox, and Safari did not utilize the accent color chosen for my forms. Safari also displayed the social media icons in the footer notably smaller than Chrome and Firefox. Overall, using the developer tools on Firefox and Safari was very insightful since I was only familiar with those available on Chrome.
